

Endpoint malware infection response

Malware · **High** severity · SOC IR Playbook

Severity

High

Detection & Analysis

- **Triage the EDR alert** — Confirm the detection, identify the host, user, process tree and file hashes.
- **Determine blast radius** — Check the hash/IOCs across the fleet for other infected hosts.

Containment

- **Isolate the host** — Network-isolate the endpoint via EDR; preserve volatile evidence first if feasible.

Eradication

- **Remove the malware** — Kill/quarantine the malicious process and persistence, remove dropped files and scheduled tasks.

Recovery

- **Rebuild or clean** — Re-image if integrity is uncertain; restore from known-good backup; rotate credentials used on the host.

Post-Incident

- **Tune detections** — Add IOCs to blocklists, create/refine the detection rule, record lessons learned.
